# LiDAR Documentation

Dear user, first of all, i wanna thank you, that you purchased this asset. Below I will point out some important aspects of this package, to prevent you to stumble into any inconveniences.

Never the less ff you run into any kind of problem relate to this package, feel free to contact me via e-mail or twitter.

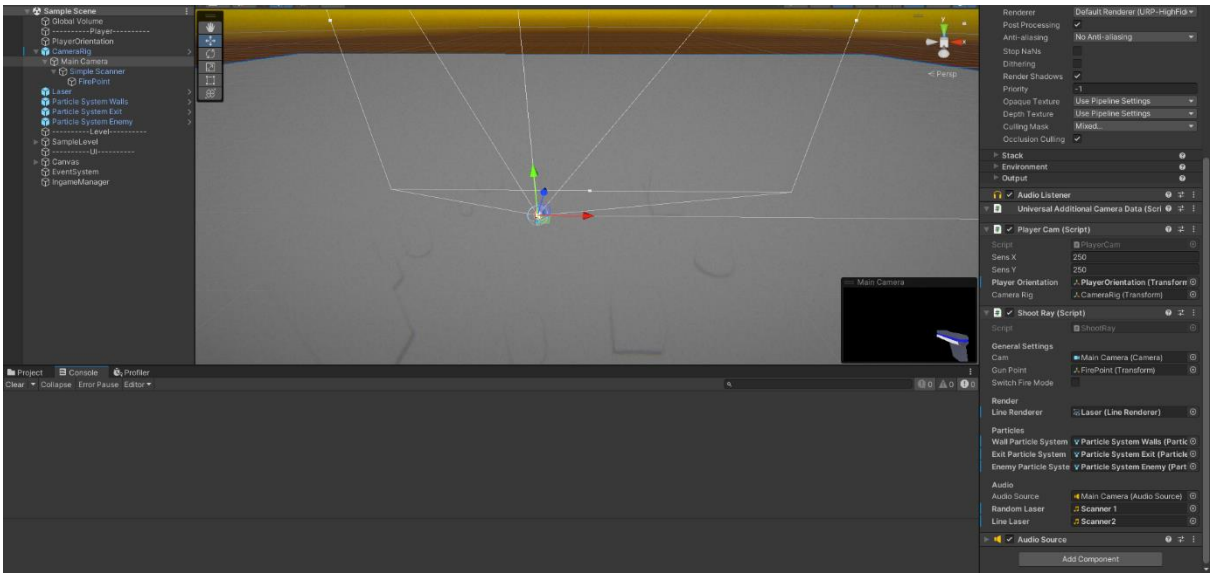
Step 1.

I definitely recommend you to take a look inside the sample scene, included in this package. To have the scanner work correctly you always need the following components:

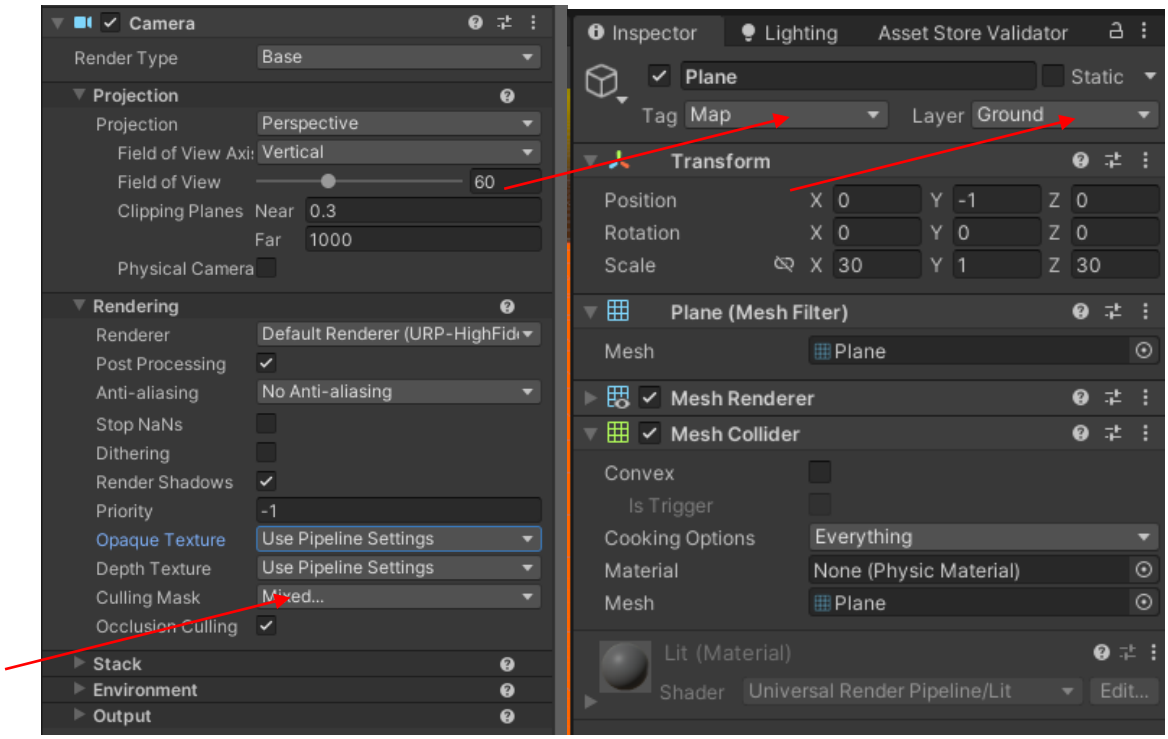
- A camera (in a rig or separately. It's up to your project)
- Attached to the camera is the PlayerCam Script (in case you don´t have your own) and the ShootRay Script. Also add an Audio Source to your camera
- A Line Renderer Gameobject (Laser)
- At least one Particle System for the level-geometry
- Your level



Step 2.

Modify your Culling Mask under MainCamera → Rendering → Culling Mask, by unchecking the layer, all Level-Assets are set to. The Camera won´t render this components anymore.

You could alternatively delete the mesh renderer of each gameobject if you want, but this will be much more work to do.



Note: Make sure, that you use only „Exit“ or „Enemy“ as a tag, if you want to mark an object as an enemy or the exit / door. Any other tag will be handeld as a default object (More variation coming in the next update).
